

Rising Beyond Borders

Document 19 — Production Content Population & Data Readiness

Master Specification + Claude Code Implementation Prompt

Purpose: define the controlled process for replacing the current content-safe placeholders with real, Rising Beyond Borders-approved production content. This document does **not** introduce a CMS, admin dashboard, database, authentication system, or backend.

Operating principle: content is populated only from material supplied or explicitly approved by Rising Beyond Borders. No missing fact may be invented to make a section look complete.

1. Scope

- Populate the existing repository-based content architecture with approved RBB content.
- Keep the existing information architecture, routes, component system, accessibility behavior, SEO architecture, and editorialStatus publishing gate intact.
- Establish a repeatable source → verification → approval → entry → QA → build → review workflow.
- Prepare the site for a final content freeze before launch.
- Identify missing content clearly instead of filling gaps with assumptions.

2. Content Readiness Rules

State	Meaning	Production behavior
Approved	RBB has supplied/reviewed the content and approved publication.	May publish.
Verified	Source-backed content confirmed for use.	May publish where the existing system treats verified as approved.
Pending review	Content exists but RBB approval is incomplete.	Do not publish.
Draft	Working editorial material.	Do not publish.
Archived	Previously usable material intentionally retired.	Do not publish.
Missing	No approved source exists.	Keep placeholder/empty state.

3. Production Content Inventory

Area	Content	Readiness rule
Homepage	Hero, Who We Are, four areas of work, approach, impact, featured work, and stories.	Use only approved, verified figures, projects and stories.
About	Who We Are, Mission & Vision, Values, How We Work, Team, Transparency	Mission/vision are source-confirmed; values/team require RBB approval.
Programs	Education, Health & Wellbeing, Livelihoods, Community Support	Descriptions exist; projects, outcomes and imagery require approval.
Projects	Project records, imagery, locations, impact, partners	Populate only approved records; keep project lifecycle status separate.
Impact	Metrics, program impact, geography, approach, measurement, stories, reports	50K+ and 78/12/10 remain pending until RBB verifies them.
Stories	News, field, impact and community stories	Only approved stories publish.
Team	People, roles, bios, images, groups	No names, roles or photos may be invented.

Area	Content	Readiness rule
Transparency	Financial overview, annual reports, financial documents, governance	no audit/CRA/tax/registration claims unless supplied and approved.
Contact	Contact methods, office, social, hours, response expectations	Currently no verified contact data; do not invent.
Donation	Giving methods, donation process, FAQs, trust information	Remain pending until provider/process/currency/tax/receipt details are
Policies	Privacy, Terms, Accessibility, Cookies	Publish only after RBB/legal review.

4. Source & Approval Matrix

Every production content item should have a traceable source. The implementation should not create a new public claim simply because a component has an empty field.

- **Source-confirmed:** directly supported by the RBB source material already supplied or by a later authoritative RBB document.
- **RBB-approved proposal:** wording or structure proposed by the project team and explicitly approved by RBB.
- **Pending:** awaiting RBB confirmation. Keep the existing pending state.
- **Unknown:** do not publish. Do not infer from another organization, old website, social post, or generic NGO convention.

5. High-Priority Verification Queue

- Impact figures: 50K+ lives impacted, 25 countries reached, 200+ partners & donors worldwide.
- Financial overview: Programs & Services 78%, Fundraising 12%, Administration 10%.
- Any additional impact figure, including the previously encountered 120+ figure, must remain excluded until clarified.
- Mission and vision wording: use the approved source wording without silently rewriting it.
- Values: obtain the final approved values list.
- How We Work: determine whether RBB wants an official framework; do not publish Listen → Partner → Act → Sustain as official methodology without approval.
- Team: names, roles, groups, biographies, photos, ordering and governance relationship.
- Projects: titles, descriptions, program, locations, lifecycle status, impact, partners and approved images.
- Where We Work: actual countries/regions and map data, if RBB wants this section populated.
- Stories: approved stories, authors, dates, images, quotes and outcomes.
- Annual reports and financial documents: real files/URLs only.
- Contact: official email, phone, address, office details, social links and hours if applicable.
- Donation: payment provider, currency, methods, recurring giving, tax/receipt/refund language and final process.
- Privacy/Terms/Accessibility/Cookies: final reviewed policy text and dates.

6. Content Entry Standards

- Preserve approved names, capitalization, punctuation and terminology consistently across pages.
- Use stable lowercase hyphenated slugs for new content; do not casually rename published slugs.
- When a published slug must change, add an explicit redirect and update internal references.
- Every published image needs an approved asset and useful alt text; decorative imagery must be intentionally marked decorative.
- Do not put confidential drafts, private contact details, unpublished donor information or sensitive internal material into public source files.
- Do not embed credentials, API keys, provider secrets, payment secrets or private URLs in content files.
- Keep project lifecycle status and editorialStatus separate.

- Do not duplicate facts manually when an existing shared data source already owns them.
- Do not create fake testimonials, partner logos, country lists, staff profiles, donation amounts or financial claims.

7. Cross-Page Consistency QA

- Homepage program labels match program pages and navigation.
- Impact metrics use the same approved values everywhere they appear.
- Stories referenced by Home/Impact actually exist and are approved.
- Projects referenced by program pages actually exist and are approved.
- Team people shown on About are approved and match their profile records.
- Financial figures match the Transparency source of truth.
- Donation CTAs point to the canonical donation route.
- Legacy routes continue to redirect as specified.
- SEO titles/descriptions reflect final visible content.
- No unpublished record appears in HTML, JavaScript bundles, sitemap, structured data or route generation.
- No unsupported legacy organization claims have returned.

8. Image & Media Readiness

- Create a controlled approved media inventory before replacing placeholders.
- Record source, license/permission status, intended page, crop/aspect needs and alt text.
- Do not reuse images merely because they visually resemble the intended section.
- Do not use stock imagery in a way that could be interpreted as depicting RBB beneficiaries, staff or field work unless clearly appropriate and approved.
- Keep responsive image generation and the existing Picture component.
- Avoid shipping unused high-resolution originals into the public bundle.
- Check mobile crops separately from desktop crops.

9. Content QA Checklist Before Final Freeze

- All public copy reviewed by RBB.
- All people/projects/stories/images explicitly approved.
- All metrics and financial figures verified.
- All contact details verified.
- Donation flow and provider details approved before enabling payments.
- Policy text legally/relevantly reviewed by RBB.
- No placeholder language remains on pages intended to launch.
- Any intentionally empty section has an approved reason and launch decision.
- No unsupported claim exists in production output.
- All links, redirects, anchors and downloadable documents work.
- Accessibility regression run after content population.
- SEO metadata reviewed after final copy.
- Build content report shows exactly the expected approved records.
- Sitemap contains only approved/indexable URLs.
- Production bundle contains no held-back content.
- Final content freeze is tagged/versioned internally before launch.

10. Final Content Freeze

The content freeze is a launch-control step, not a new CMS feature. After RBB approves the launch content set, changes should be treated as controlled production changes: update the source, run validation, review the build report, run route/accessibility/SEO checks, and obtain the required approval before deployment.

11. Do Not Change in This Phase

- Do not add a CMS.
- Do not add an admin dashboard.
- Do not add authentication.

- Do not add a database or content API.
- Do not redesign the site.
- Do not replace the existing editorialStatus publishing gate.
- Do not enable analytics, payments, forms or third-party providers as a side effect of content population.
- Do not invent missing RBB facts.

12. Claude Code Implementation Prompt

You are implementing Document 19 – Production Content Population & Data Readiness for the Rising Beyond Borders website.

GOAL

Populate the existing repository-based content architecture with RBB-approved production content while preserving all existing architecture and safety gates.

NON-NEGOTIABLE

- No CMS.
- No admin dashboard.
- No login/auth.
- No database/API/backend.
- No new analytics/payment/form provider.
- No redesign.
- Do not invent facts.
- Keep editorialStatus separate from project lifecycle status.
- Only approved/verified records may publish.
- Pending/draft/archived records must not reach production HTML, JS bundles, sitemap, routes or structured data.

WORKFLOW

1. Inspect the current src/content files, content validation, publishing filter, route configuration, SEO layer, image system and build report.
2. Do not overwrite existing architecture merely to make content entry easier.
3. Create/update content only from the approved RBB source material supplied to the project.
4. Preserve exact approved Mission and Vision wording.
5. Keep the four program descriptions consistent across Home, Work and related pages.
6. Treat 50K+, 25, 200+ and 78/12/10 as pending verification until RBB explicitly approves them.
7. Do not publish the 120+ figure unless RBB explicitly clarifies and approves it.
8. Do not invent values, team members, projects, countries, partners, contact details, financial claims, donation methods, testimonials, stories or policy text.
9. If a required field has no approved source, leave it in the existing pending/empty state.
10. Keep slugs stable. If a new approved slug replaces an existing route, add an explicit redirect and update references.
11. Use approved media only and provide meaningful alt text.
12. Keep shared source-of-truth data shared; do not duplicate facts across unrelated content files.
13. Run content validation before build.
14. Run the production build and inspect the content report.
15. Verify that held-back records are absent from generated HTML, JS, sitemap, structured data and route output.
16. Run route, responsive, accessibility, SEO and hydration checks after population.
17. Do not stage or commit changes.

CONTENT AREAS

- Homepage
- About
- Mission & Vision
- Values

- Team
- Four programs
- Projects
- Impact
- Where We Work
- Our Approach
- Stories
- Transparency & Financials
- Contact
- Donation
- Policies
- SEO metadata and approved media

SOURCE DISCIPLINE

For every non-trivial production claim, be able to identify its RBB source or approval. Do not use old Muslim Hands content, generic NGO content, inferred geography, or assumptions to fill gaps.

QA

Check cross-page consistency for names, metrics, programs, stories, projects, donation routes, contact details, financial figures, redirects and SEO metadata.

REPORT

At the end report:

- files changed
- approved records published
- records held back
- unresolved content questions
- validation result
- build result
- accessibility result
- route/redirect result
- sitemap result
- whether any unsupported claim was detected
- whether anything was staged or committed

If source material is missing, stop at the missing-content boundary rather than inventing replacement content.

13. Acceptance Criteria

- Real approved RBB content can be entered without changing the site architecture.
- Unapproved content remains excluded from production output.
- Every populated section has a traceable source/approval status.
- No unsupported claim is introduced.
- Cross-page content remains consistent.
- Images are approved, optimized and accessible.
- Validation/build/SEO/accessibility checks pass.

- The site remains CMS-free and provider-free in this phase.
- Final content freeze can be performed as a controlled launch step.

Document status: Master specification for implementation. RBB approval is required for factual content that is currently marked pending or missing.
