

Rising Beyond Borders

Document 23 — Final Staging Experience & Feature Completion

Master Specification + Claude Code Implementation Prompt

Purpose: Complete the website as a fully populated staging/demo experience so the RBB team can review the entire look, feel, structure, interaction model and user journey before final production content and credentials are supplied.

1. Document Purpose

This document establishes the implementation direction for the next phase after the core architecture, content, forms, email, donation and production-hardening work. The goal is no longer to hide incomplete areas behind production-safe placeholders. The staging build should expose the complete intended website experience using clearly temporary/demo content where RBB-approved material is not yet available.

2. Staging vs Production Principle

Use two explicit concepts:

Staging/demo mode: complete visual and functional experience, temporary content permitted, test integrations permitted, no live financial or production credentials.

Production mode: only RBB-approved content, approved legal/contact information, approved imagery/licensing, approved providers and live credentials.

Do not weaken server-side security merely to populate the staging experience.

3. Global Completion Requirement

Every meaningful navigation item, CTA, page section and major interaction should be represented in staging. A visitor should be able to understand the intended final product without encountering large areas that simply say “to be provided” or “not open yet.”

4. Content Population Strategy

Populate missing areas with realistic, clearly temporary demonstration content. Do not present demo facts as verified RBB facts. Where the UI requires an organization-specific fact, use neutral staging wording such as “Demo content — replace with RBB-approved information” or an equivalent editorial marker that does not damage the design.

Temporary content may include sample stories, project descriptions, team profiles, locations, impact examples, contact details and policy text solely for staging review. The final content workflow from Document 19 remains the authority for production publishing.

5. Images

Use relevant Pexels imagery temporarily for the complete visual experience. Select imagery appropriate to the section rather than generic stock wherever possible: education, health and wellbeing, livelihoods, community support, volunteers, field work, team, stories and community scenes.

Store image references through the existing image/content architecture. Preserve meaningful alt text. Do not treat Pexels images as final RBB-owned campaign photography. Before production launch, replace or explicitly license/approve every image.

6. Header & Navigation

Show the complete navigation structure from the approved IA. All dropdowns and mobile navigation states should be populated. Every visible navigation destination should resolve to a meaningful staging page. Remove unnecessary “coming soon” dead ends during this phase.

7. Homepage

Populate all homepage sections defined in Document 02:

Hero; Who We Are; Our Areas of Work; Our Approach; Our Impact; Featured Work; Stories of Change; Transparency & Trust; Get Involved; Final CTA; Footer.

The previously hidden approach flow may be shown in staging as **demonstration content**, clearly marked internally as pending RBB approval. Likewise, the impact figures may be rendered in the intended visual treatment with a staging indicator until the RBB values are verified.

8. About Us

Complete the visual experience for Who We Are, Mission & Vision, Values, How We Work, Team and Transparency/Governance. Populate team cards and profiles with clearly temporary demo identities rather than leaving empty grids. Do not imply that demo people are actual RBB staff.

9. Our Work

Populate the four program pages and the Projects directory with representative staging projects. Include project cards, project detail pages, program relationships, location, status, impact, imagery and related content so filters, cards and navigation can be reviewed. Mark project records as staging/demo internally and ensure they cannot accidentally ship as factual production records.

10. Our Impact

Complete Impact at a Glance, program impact, Where We Work, Our Approach, Evidence & Measurement, Impact Stories and Reports/Transparency connections. A staging map or geographic presentation may be used with clearly temporary locations. Do not silently convert demo geography into verified RBB coverage.

11. Stories

Populate the Stories hub and several detail pages covering the four approved category types: News & Updates, Field Stories, Impact Stories and Community Stories. Use temporary authors, dates, excerpts, bodies and imagery for staging. Ensure category filters, related stories and program/project relationships work.

12. Get Involved

Show complete Donate, Volunteer, Partner and Fundraise experiences. All forms should be visually present in staging. Contact details and destination configuration may use explicit staging/demo values. Submission flows should use the existing server integration and test mode rather than fake browser-only success states.

13. Donations

The Donate page should expose the complete donation UX in staging. Keep Razorpay in test mode until real RBB test credentials are supplied and validated. Show amount selection, donor fields, validation, checkout entry, processing, success, failure, cancellation/retry and verification states. Never expose Razorpay secrets in client code.

14. Contact & Newsletter

Contact and Subscribe/Newsletter experiences should be visible. Contact should show realistic staging contact information and the form UI. Newsletter should show consent, validation, submission and confirmation states according to the existing form architecture. Use Resend/test configuration rather than hard-coded fake success.

15. Legal & Policy Pages

Populate Privacy, Terms, Accessibility and Cookies where needed for the staging UX. Label them as staging/demo policy content and ensure the production publishing gate still prevents unapproved policy text from being represented as final RBB policy.

16. Transparency & Financials

Render the complete financial overview, annual reports, financial documents and governance experience. Use clearly labelled staging/demo records where RBB documents are not available. Do not invent real monetary amounts, audit certifications, registrations or tax claims as facts.

17. Team & Organization

Render leadership/team group layouts, profile cards, profile pages, biographies, images and related links using explicitly temporary demo people. The component architecture must remain compatible with the approved team data model.

18. Interaction States

Every major interactive feature should have representative states: default, hover/focus, loading, disabled, validation error, server error, success, empty, not found and retry where applicable. Do not create fake success states that bypass the actual integration.

19. Responsive & Accessibility Requirements

Preserve the WCAG 2.2 AA engineering target from Document 16. Test desktop and mobile layouts, keyboard navigation, focus visibility, semantic headings, labels, errors, reduced motion, 200% zoom and touch targets. Pexels imagery must not introduce layout shift or overflow.

20. Security Boundary

Staging completeness must not mean insecure implementation. Continue to enforce server-side validation, origin checks, CSP, secret isolation, Razorpay signature verification, webhook verification, rate limiting, content sanitization and production build exclusions. Demo content must be isolated from production-approved content.

21. Editorial Safety

Introduce or reuse a clear staging/demo marker at the content-data level. Recommended model:

environment: staging | production

editorialStatus: demo | approved | pending-review | draft | archived

Production publishing must continue to include only approved records. Demo records must be removable from the production artifact through the existing content validation/publishing pipeline.

22. SEO Behaviour

Demo-only pages/content must not accidentally become production-indexable. Preserve noindex behavior for staging-only records and ensure demo content is excluded from production sitemap and structured data. Do not create fake canonical production URLs for temporary records.

23. QA & Acceptance

Acceptance requires: complete navigation; no dead primary CTAs; all major pages visually populated; forms visible; donation journey represented; test integrations isolated; Pexels imagery loaded without overflow; responsive layouts clean; axe clean on representative routes; hydration clean; no console errors; no secrets in build artifacts; production publishing still excludes demo content; and a final inventory of demo content exists for replacement by the RBB team.

24. RBB Replacement Checklist

Before production: replace demo text; verify mission/vision/values; verify impact figures; replace demo team; replace projects and countries; replace stories; replace contact details; replace images and confirm licences; approve donation amounts/currency/fields/copy; configure Razorpay test then live credentials; configure Resend production domain/from/recipients; publish approved Privacy/Terms/Accessibility content; configure analytics only if approved; select host; audit host cookies/scripts; run final security/accessibility/performance checks; rebuild and inspect production artifact.

25. Claude Code Implementation Prompt

You are implementing Document 23 for the Rising Beyond Borders website.

OBJECTIVE

Turn the current website into a complete staging/demo experience. Do not redesign the architecture from scratch. Reuse the existing routing, content, component, form, email, donation, SEO, security, accessibility and build systems already established in Documents 01-22.

CORE RULE

For staging, show the complete intended UX. Do not hide major pages, sections, forms, cards, project grids, stories, team layouts, contact details or donation UI merely because final RBB-approved content is not yet available.

CONTENT

1. Populate every major route with realistic staging/demo content.
2. Use explicit staging/demo status in content data.
3. Never represent demo facts as verified RBB facts.
4. Keep the production content validation gate intact: demo records must not publish as approved production records.
5. Preserve the existing approved Mission/Vision wording where already sourced.
6. For unsupported organization-specific facts, use clearly marked demo content rather than inventing factual claims.

IMAGES

1. Use relevant Pexels imagery temporarily.
2. Prefer context-appropriate imagery.
3. Preserve alt text and responsive image handling.
4. Do not introduce large unoptimized assets.
5. Maintain an inventory of temporary image references for later replacement.

FORMS

1. Make Contact, Newsletter/Subscribe, Volunteer, Partner and Fundraise forms visibly present.
2. Connect them to the existing server-side form architecture.
3. Use test/staging configuration.
4. Do not create client-only fake success.
5. Preserve validation, anti-spam hooks, rate limits and generic server responses.
6. Do not expose email API keys or recipients in browser code.

DONATIONS

1. Show the complete donation UI in staging.
2. Keep live Razorpay disabled until RBB live credentials are supplied.
3. Use Razorpay test mode when test credentials are available.
4. Preserve server-side amount/currency/order/signature/payment verification.
5. Preserve webhook verification and idempotency.
6. Show success only for captured/verified payments.
7. Keep processing, failed, cancelled, retry and unknown states.
8. Do not put any Razorpay secret in the client or build artifact.

PAGES TO COMPLETE

Home

About / Team / Team profiles

Work / four programs / Projects / Project details

Impact / Where We Work / Approach

Stories / story details

Get Involved / Donate / Volunteer / Partner / Fundraise

Contact

Transparency / Financials

Policies

Careers

Legacy routes only where still intentionally retained by the existing architecture.

NAVIGATION

Every primary navigation item and major CTA must lead to a meaningful staging experience. Remove accidental dead ends.

ACCESSIBILITY

Maintain WCAG 2.2 AA engineering target. Test keyboard, focus, headings, labels, errors, reduced motion, responsive layouts, touch targets and zoom.

SECURITY

Do not weaken CSP or secret handling just to make the UI complete. Keep staging credentials server-side. Keep production artifact scans clean.

SEO

Demo content must be excluded from production sitemap/structured data/indexable production output unless explicitly approved. Preserve canonical/noindex logic.

QA

Run:

- content validation
- production build
- hydration checks
- representative route crawl
- axe accessibility tests
- responsive/mobile checks
- console-error scan
- secret scan
- dependency/security scan
- donation checks where test credentials exist
- forms/email test mode
- production artifact inspection

REPORT

Return:

1. routes completed
2. sections completed
3. forms enabled
4. donation states completed
5. temporary images added
6. demo content added
7. integrations tested
8. tests run/results
9. remaining RBB decisions
10. files changed
11. anything that must NOT be committed
12. confirmation that demo content cannot leak into the production-approved build.

Do not stage or commit anything.

26. Definition of Done

Area	Done when
Visual completeness	All major pages and sections contain realistic staging content.
Navigation	Primary navigation, dropdowns, mobile menu and CTAs have meaningful destinations.
Forms	Contact, Subscribe, Volunteer, Partner and Fundraise are visible and testable.
Donation	Complete test-mode UX is visible; live mode remains gated.
Images	Relevant temporary Pexels imagery is used and responsive.
Content safety	Demo content is marked and excluded from approved production publishing.
Accessibility	Representative routes pass automated checks and manual keyboard/responsive review.
Security	No secrets, unsafe endpoints or CSP regressions.
SEO	Demo content cannot accidentally enter production sitemap/index/structured data.
QA	Build, hydration, console, security and integration checks pass.

Implementation instruction: Complete this phase without staging or committing changes. Report the working-tree state so deliberate reconciliation can happen before any future commit.
